

# Radiosity

---

## Last lecture

- Radiosity equation
- Form factors
- Solution methods

## Today

### Two major problems

- Quality of approximation
  - Meshing given shadows
- Computational expense
  - Quadratic to linear time using hierarchical techniques

CS348B Lecture 17

Pat Hanrahan, Spring 2000

# First Radiosity Pictures ...

---

Parry Moon and Domina Spencer (MIT), *Lighting Design*, 1948

CS348B Lecture 17

Pat Hanrahan, Spring 2000

## Accuracy

---

Reference Solution

Uniform Mesh

Table in room sequence from Cohen and Wallace

CS348B Lecture 17

Pat Hanrahan, Spring 2000

## Artifacts

---

- A. Blocky shadows
- B. Missing features
- C. Mach bands
- D. Inappropriate shading discontinuities
- E. Unresolved discontinuities

Error Image

CS348B Lecture 17

Pat Hanrahan, Spring 2000

## Meshing Options

---

- Element type
  - Regular or structured: quadrilaterals
  - Irregular or unstructured: triangles
- Element size
  - Resolution:  $h$
- Element order and continuity
  - Polynomial order:  $p$
  - Degree of continuity across elements
- Element goodness
  - Shape, e.g. aspect ratio
  - Placement, e.g. grading

CS348B Lecture 17

Pat Hanrahan, Spring 2000

## Increasing Resolution

---

CS348B Lecture 17

Pat Hanrahan, Spring 2000

## Adaptive Meshing

---

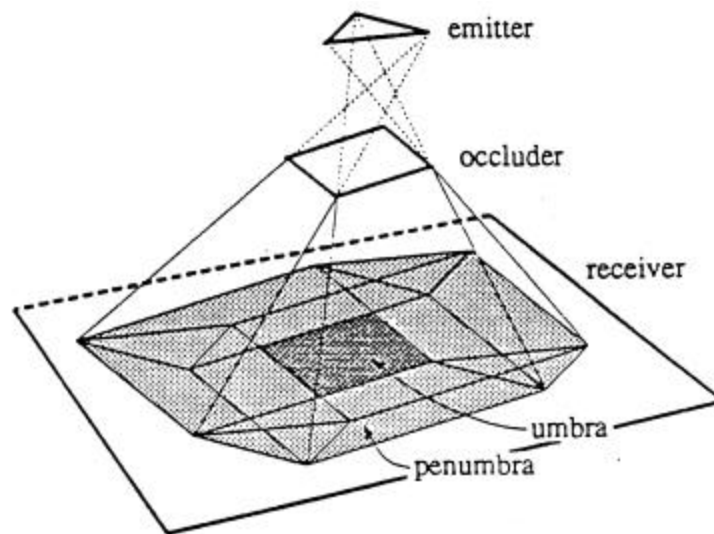

CS348B Lecture 17

Pat Hanrahan, Spring 2000

## Penumbras and Umbra

---

CS348B Lecture 17

Pat Hanrahan, Spring 2000

## Irradiance Discontinuities

---

Lischinski, Tampieri, Greenberg

## Campbell et al. BSP Mesh

---

# Heckbert Constrained DT Mesh

Critical edges

CS348B Lecture 17

Pat Hanrahan, Spring 2000

# h- vs. p-refinement

Subdivide element vs. raise degree?

Continuous, smooth functions

■ Raise degree  $O(h^p)$  convergence

Discontinuous functions

■ Subdivide at discontinuity

- uniform constant
- uniform Gouraud
- uniform linear
- discontinuity-meshed constant
- discontinuity-meshed Gouraud
- discontinuity-meshed linear

From Heckbert

Pat Hanrahan, Spring 2000

CS348B Lecture 17

## Hierarchical Techniques

---

Problem: Form factor matrix has  $O(n^2)$  entries

Basic approach:

1. Numerical calculations subject to error.  
Only compute things to the required precision.
2. Small, far-away elements can be replaced by larger elements
3. These observations lead to a linear time algorithm

Motivated by solutions to the N-body problem

## Disk Form Factor

---

$$\begin{aligned} F_{disk} &= \sin^2 a \\ &= \frac{r^2}{r^2 + R^2} \\ &= \left(\frac{r}{R}\right)^2 \left(1 - \left(\frac{r}{R}\right)^2 + \left(\frac{r}{R}\right)^4 - \dots\right) \end{aligned}$$

The five-times rule: A finite area Lambertian reflector may be modeled as a point light source when the distance to the receiving surface is five times greater than the size of the light source

## Basic Refinement Algorithm

---

```
Refine(Patch *p, Patch *q, float Feps, float Aeps)
{
    float Fpq = FormFactorEstimate(p,q);
    float Fqp = FormFactorEstimate(q,p);
    if( Fpq < Feps && Fqp < Feps ) Link(p,q)
    else {
        if( Fpq > Fqp ) {
            if( Subdiv( q, Aeps ) ) {
                Refine( p, q->ne, Feps, Aeps );
                Refine( p, q->se, Feps, Aeps );
                Refine( p, q->nw, Feps, Aeps );
                Refine( p, q->sw, Feps, Aeps );
            }
            else Link( p, q );
        }
        else ...
    }
}
```

CS348B Lecture 17

Pat Hanrahan, Spring 2000

## Example: Two Perpendicular Polygons

---

CS348B Lecture 17

Pat Hanrahan, Spring 2000

# Blocking Form Factor Matrix

---

CS348B Lecture 17

Pat Hanrahan, Spring 2000

# $O(n)$ Interactions

---

CS348B Lecture 17

Pat Hanrahan, Spring 2000

## Recursive Gather

---

```
Gather(Patch *p)
{
    Patch *q; float Fpq;

    if( p ) {
        p->Bg = 0;
        ForAllElements( q, p->interactions ) {
            Fpq = FormFactor( p, q );
            p->Bg += Fpq * p->Cd * q->B;
        }
        Refine( p->ne );
        Refine( p->se );
        Refine( p->nw );
        Refine( p->sw );
    }
}
```

CS348B Lecture 17

Pat Hanrahan, Spring 2000
